About WordPress

What is WordPress? WordPress is an online, open source website creation tool written in PHP. But in non-geek speak, it's probably the easiest and most powerful blogging and website content management system (or CMS) in existence today.

The possibilities are endless when it comes to customizing a WordPress website. WordPress themes and plugins can add new design options and added functionality.

Log in to WordPress

- 1 To access the WordPress dashboard all is needed is simply add “/wp-admin” to the end of the URL where WordPress is installed. For example: example.com/wp-admin
- 2 Type the username and password created when WordPress was installed. When user logs in to the WordPress, the dashboard will be shown.

The WordPress dashboard contains the menu items located on the left side of the screen. They will be described detailed in the following sections.

Posts

Post in WordPress is a **post type** that is typical for and most used by blogs. **Posts** are normally displayed in a blog in reverse sequential order by time (newest posts first). **Posts** are also used for creating the feeds.

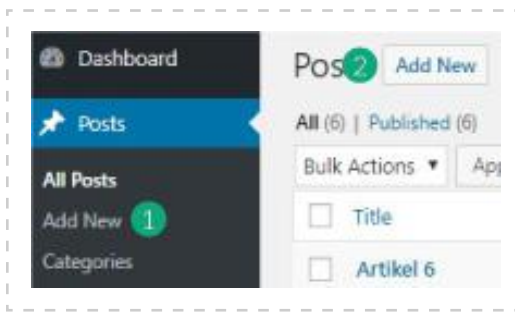

Image 1 - Backend look of Add new post

To add a new Post, hover over the **Posts** menu option in the left-hand navigation menu and in the fly-out menu, click the **Add New** link (1).

Alternatively, click the **Posts** menu option and then click the **Add New** link underneath, or the **Add New** button at the top of the page (2) as shown on Image 1.

Category

Category is one of the pre-defined taxonomies in WordPress. It is used to sort and group content into different sections. A website publishing content on a variety of topics can divide their website into sections using categories.

Example: A news website can have categories for articles filed under **News**, **Opinion**, **Weather**, **Sports**, etc.

If no category is specified for a post then the post is automatically filed into the default category. In a new WordPress installation, the default category is **Uncategorized**. A website administrator can change default category from **Settings » Writing** screen. A WordPress post can be filed under multiple categories and can have both categories and tags.

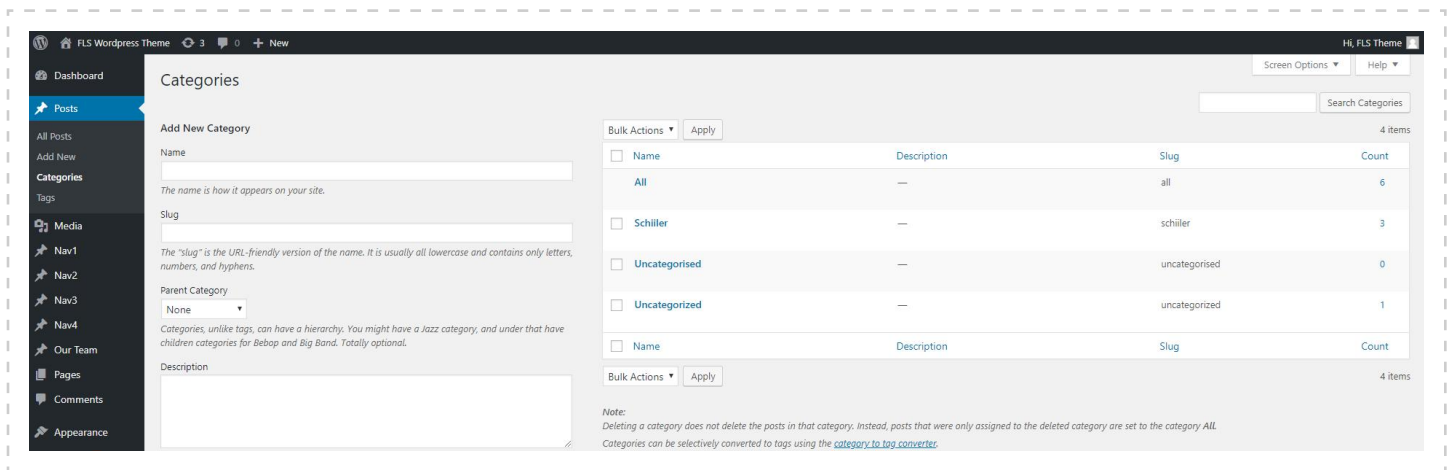

Image 2 - Backend look of Categories

Add Categories

You can create a category in WordPress while writing a post.

There is a categories meta box on the post editor screen with a list of existing categories. You can file your post in existing categories by checking the box next to the category name. You can also create one by clicking on the **+ Add New Category** link.

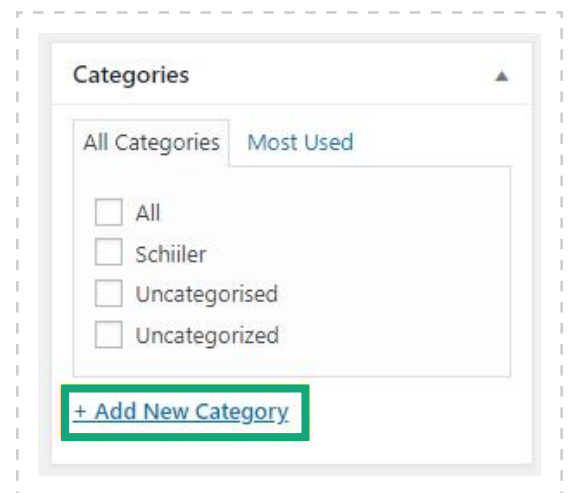

Image 3 - Backend look of Categories

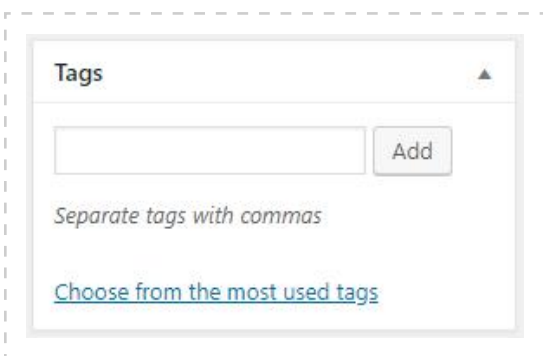

Image 4 - Backend look of Tags

Tags

Tag is one of the pre-defined taxonomy in WordPress. Users can add tags to their WordPress posts along with categories. However, while a category may cover a broad range of topics, tags are smaller in scope and focused to specific topics. Think of them as keywords used for topics discussed in a particular post.

In WordPress, if a user does not select a category for a post, then it is automatically filed into the default category. However, tags are not automatically added to a post unless a user adds them, which makes

them completely optional, but there is no limit how many of them can be added.

Example: A post filed in the **Book Review** category can optionally have tags like ***Fiction***, ***Mystery***, ***Stephen King*** etc.

Custom Post Types

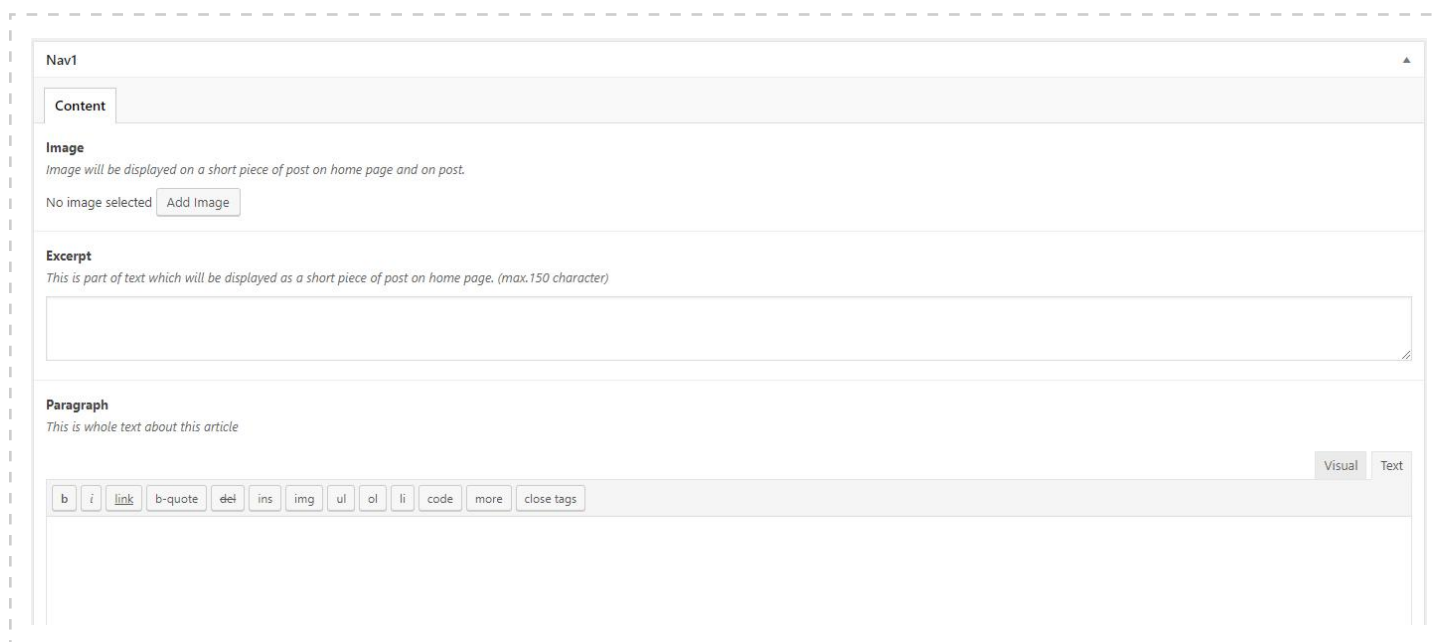

WordPress can hold and display many different types of content. A single item of such a content is generally called a post, although ***post*** is also a specific post type.

A simple definition of the Custom Post Type would be Content types like Posts or Pages that you can customize and add to your preference. They are very much like any normal posts.

This WordPress theme has few custom post types which can be universal and used to display a lot of

Nav1 Custom Post

Posts from this custom post type can be displayed on homepage as carousel or as list of 4 posts.

The screenshot shows the WordPress backend editor for a custom post type named "Nav1". The interface includes a "Content" tab, an "Image" section with a description "Image will be displayed on a short piece of post on home page and on post." and a button "Add Image", an "Excerpt" section with a description "This is part of text which will be displayed as a short piece of post on home page. (max.150 character)" and a text area, and a "Paragraph" section with a description "This is whole text about this article" and a text area. At the bottom, there is a toolbar with various formatting options like bold, italic, link, b-quote, del, ins, img, ul, ol, li, code, more, and close tags. The "Visual" and "Text" tabs are visible on the right side of the text area.

Image 5 - Backend look of Custom post Nav1

Nav2, Nav3 and Nav4 Custom Post

You can display a lot of information here to keep parents and pupils informed about school program and school activities. These posts will be displayed in the right sidebar on the pages with templates (on the website), named same as custom post type in WordPress admin panel.

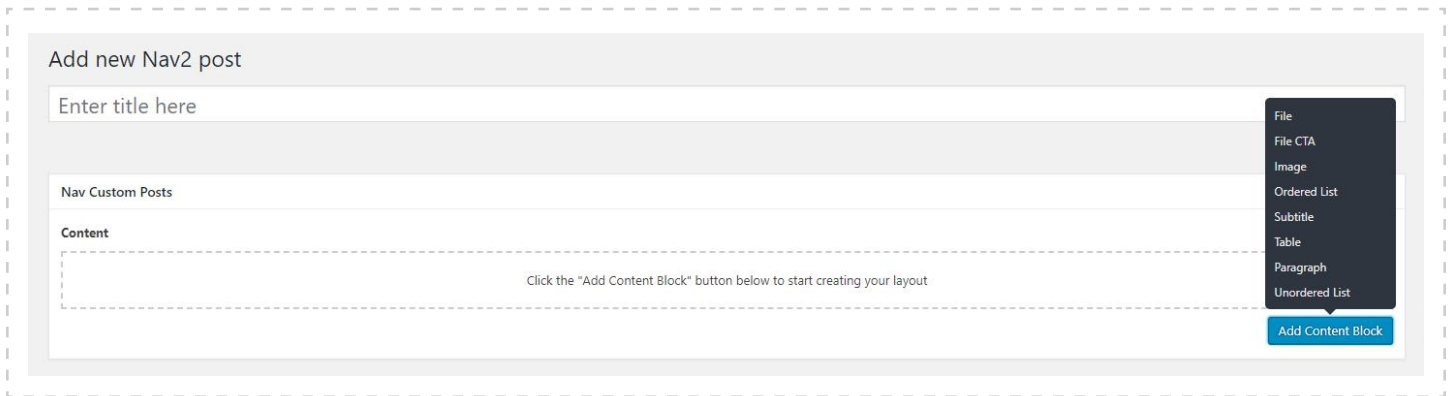

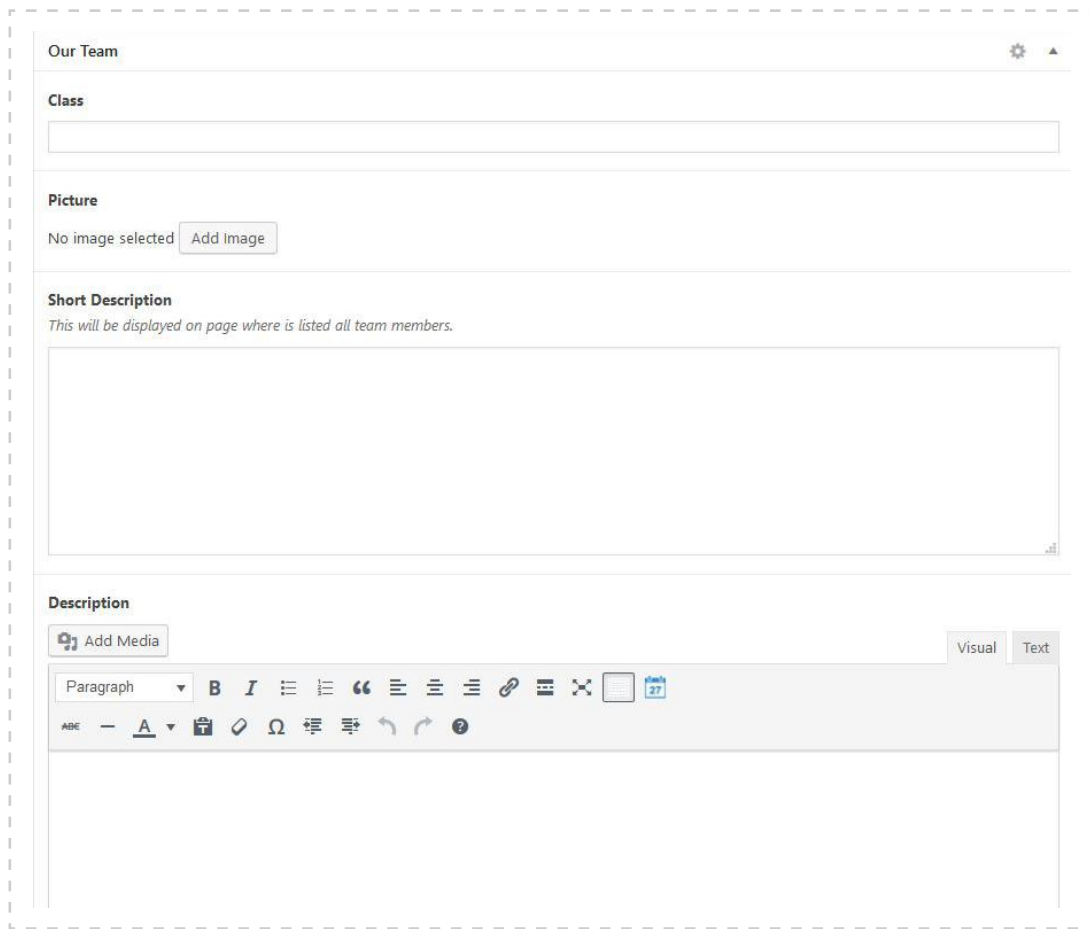

Image 6 - Backend look of Custom posts Nav2, Nav3 and Nav4

Our Team

An employee can be added separately in this custom post. In order to create staff section, with all employees, it is needed to create single page and choose "Our team" template.

This custom post can be displayed in the section "Staff" on page with "About school template".

The image shows the WordPress backend editor for a custom post type named "Our Team". The interface is enclosed in a dashed border. At the top, there's a title "Our Team" with a settings gear icon and an up arrow. Below the title is a "Class" field with an empty text input. The next section is "Picture", showing "No image selected" and an "Add Image" button. Below that is a "Short Description" section with a placeholder text "This will be displayed on page where is listed all team members." and a large text area. The bottom section is "Description", which includes an "Add Media" button, a "Visual" tab, and a "Text" tab. The "Text" tab is active, showing a rich text editor with various formatting options like bold, italic, link, and list.

Image 7 - Backend look of Custom post Our Team

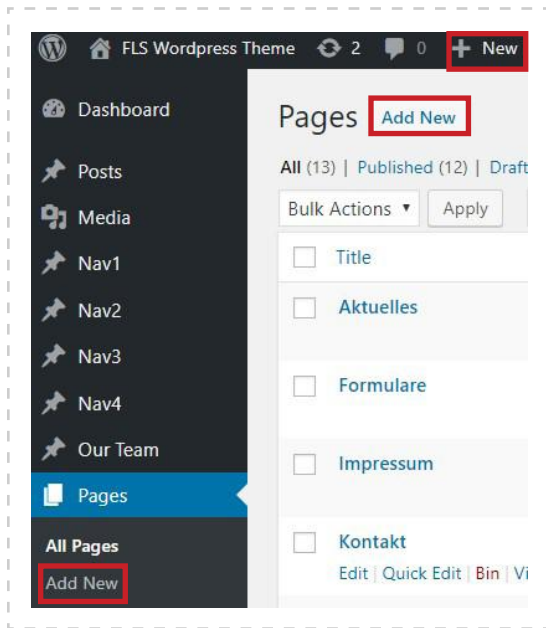

Pages

A page in WordPress usually refers to the page post type. It is one of the default pre-defined WordPress post types. Page in WordPress is like post, but it lives outside the normal time-based listings of posts. Pages can use different page templates to display them. Pages can also be organized in a hierarchical structure, with pages being parents to other pages, but they normally cannot be assigned categories and tags.

Posts vs. Pages (Key Differences)

The differences we list below definitely have exceptions. You can use plugins or code snippets to extend the functionality of both content types. Below is the list of key differences by default.

- Posts are timely vs. Pages are timeless.
- Posts are social vs. Pages are NOT.
- Posts can be categorized vs. Pages are hierarchical.
- Posts are included in RSS feed vs. Pages are not.
- Pages have custom template feature vs. Posts do not.

Create New Page

To add a new Page, hover your cursor over the **Pages** menu option in the left-hand navigation menu and in the fly-out menu, click the **Add New** link.

Alternatively, click the **Pages** menu option and then click the **Add New** link underneath, or the **Add New** button at the top of the page as shown on Image 8.

Image 8 - Backend look of Add new page
Nav2, Nav3 and Nav4

Templates

Page templates display your site's dynamic content on a page, e.g., posts, news updates, calendar events, media files, etc.

You may decide that you want your homepage to look a specific way, that is quite different to other parts of your site. Or, you may want to display a featured image that links to a post on one part of the page, have a list of latest posts elsewhere, and use a custom navigation. You can use page templates to achieve these things.

To select one of the defined templates, Go to **Add New Page** and on the right you will find dropdown menu with all the existing templates. (Image 9)

Active Templates

Active templates are templates where content and widgets can be changed, customize according to specific needs.

About School Template

This is page without sidebar on which you can display posts from regular post type “Post” and from custom post “Our Team” and say important information about school.

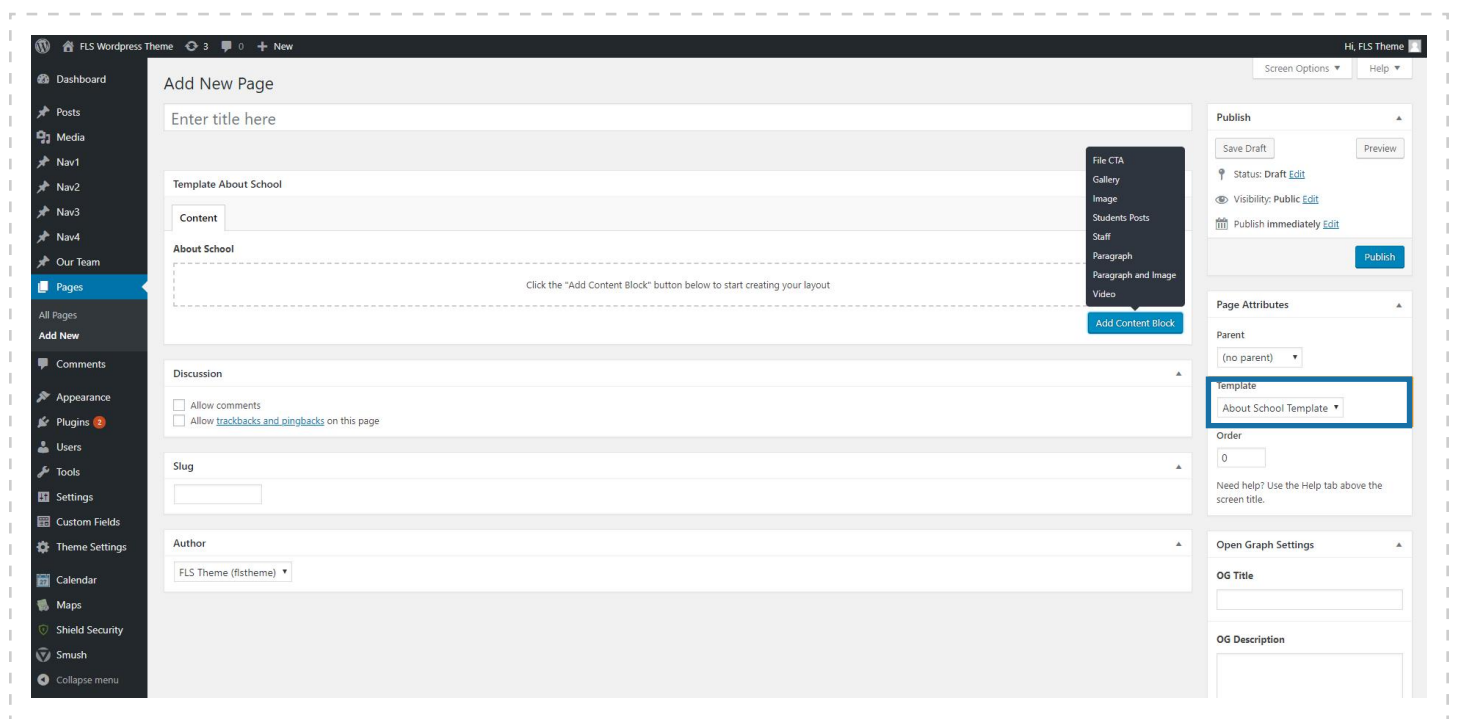

Image 9 - Backend look of About School Template

Forms Template

Here are downloadable documents with description which are separated in sections with subtitles.

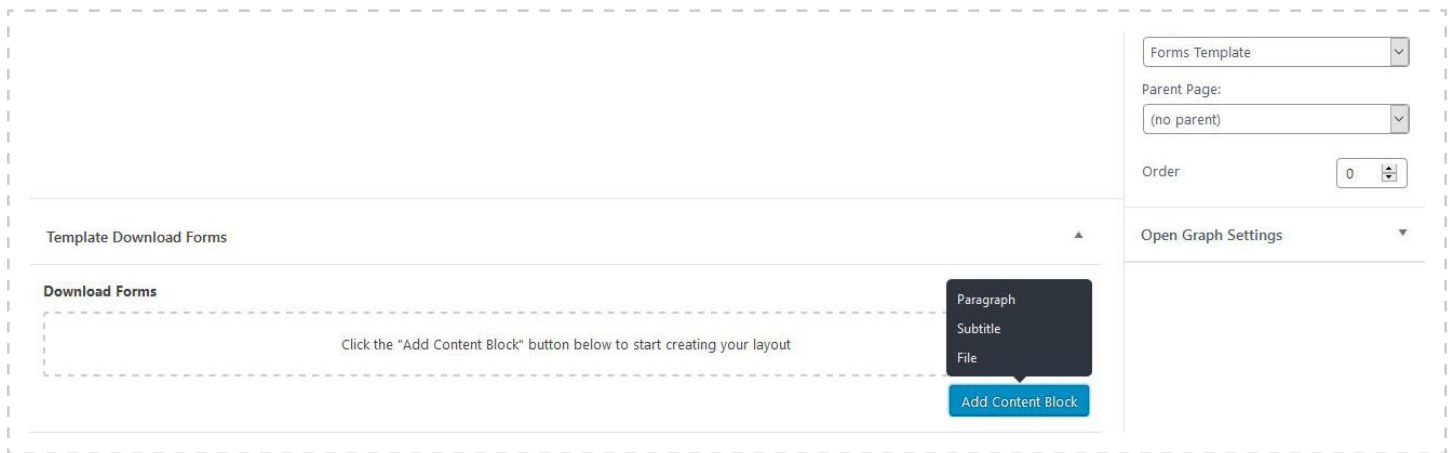

Image 10 - Backend look of Forms Template

Home Template

Template suggested to be used for front page (first page shown when someone visit the website). There are 3 different blocks which can be reordered.

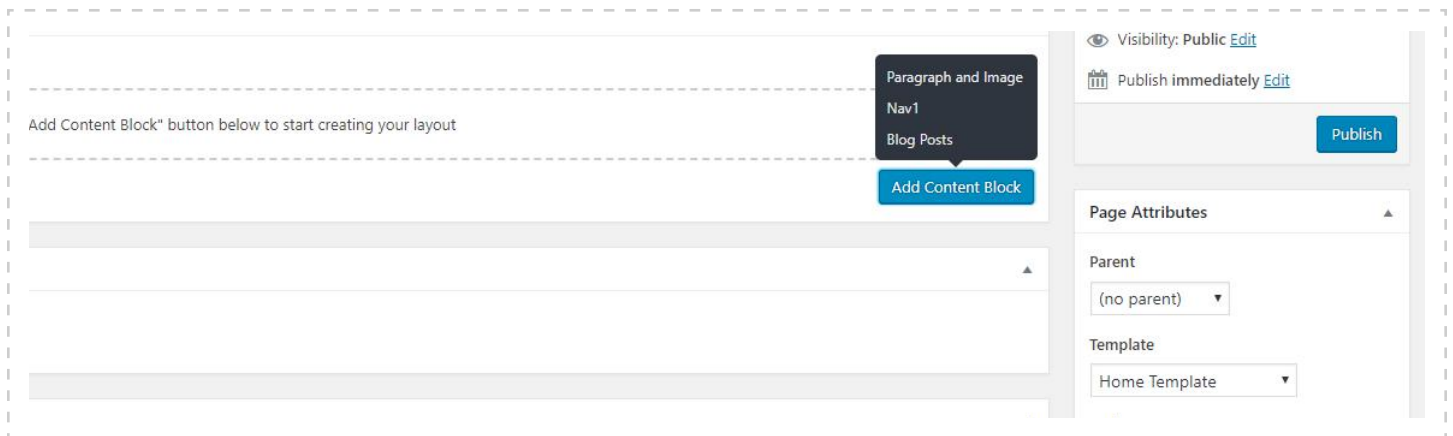

Image 11 - Backend look of Home Template

Nav2 Template, Nav3 and Nav4 Template

You can display a lot of information here as information for parents, pupils, school program and more. On these pages will be displayed sidebar with all posts from custom posts Nav2, Nav3 and Nav4.

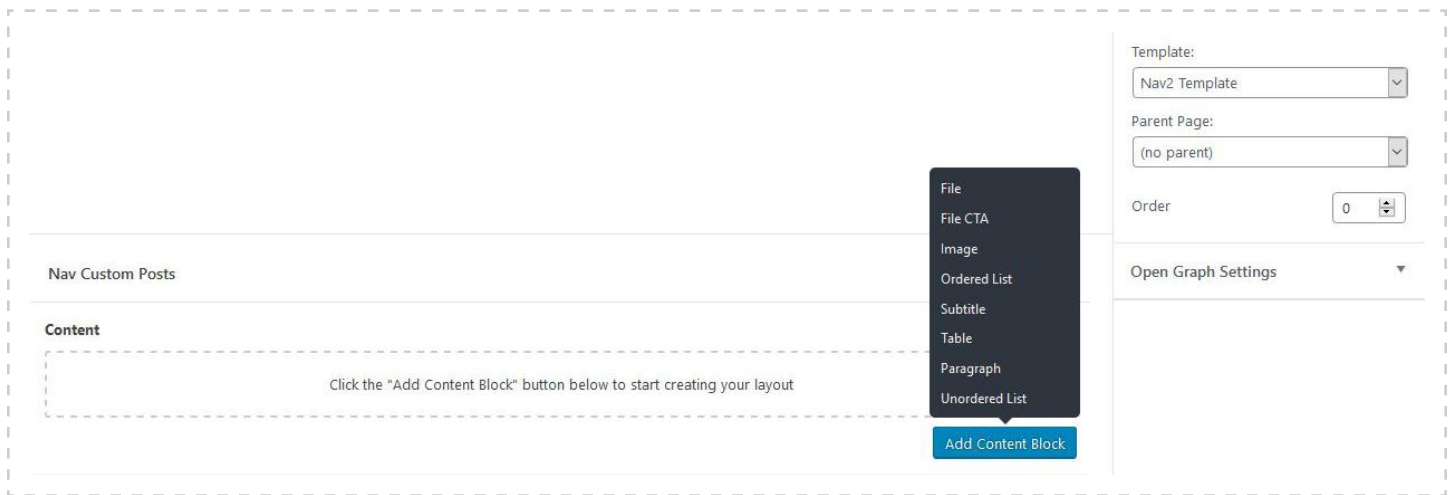

Image 12 - Backend look of Nav2, Nav3, Nav4 Templates

Contact Page Template

With this template, it can be displayed contact information about school, where it can be included addresses, email addresses, phone numbers and fax numbers. Also, if there is a more than one building, it's contact information can be added too.

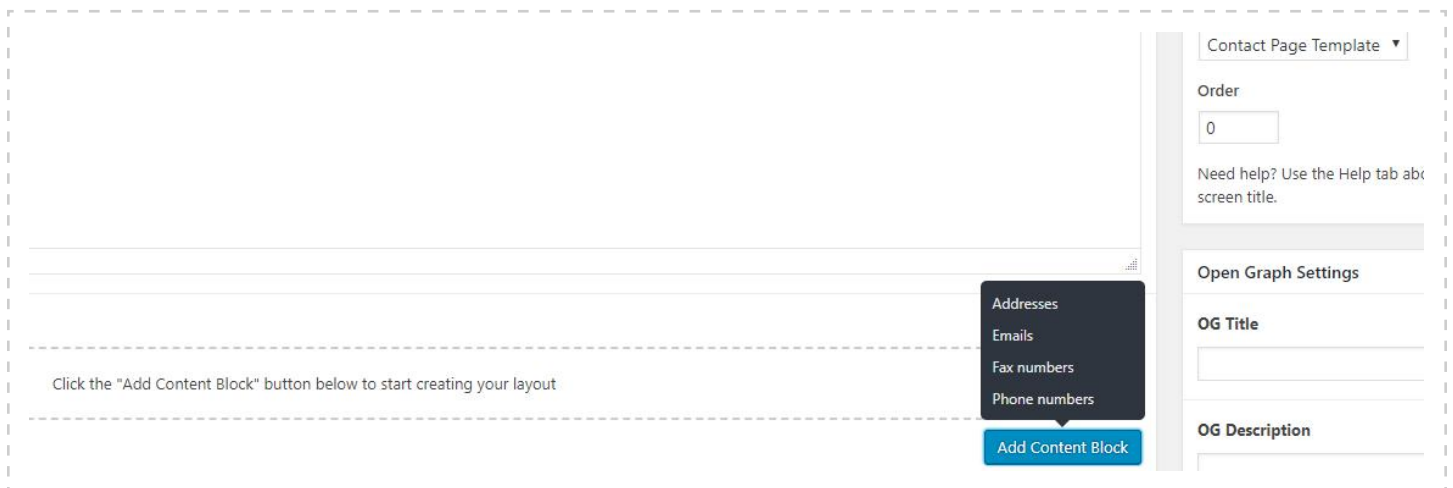

Image 13 - Backend look of Contact Page Template

Privacy Policy Template

This template is based on "Wysiwyg" editor which allows to create customized "Privacy policy" page. Since this page and its content vary from institution to institution, it can create it as it is desired and

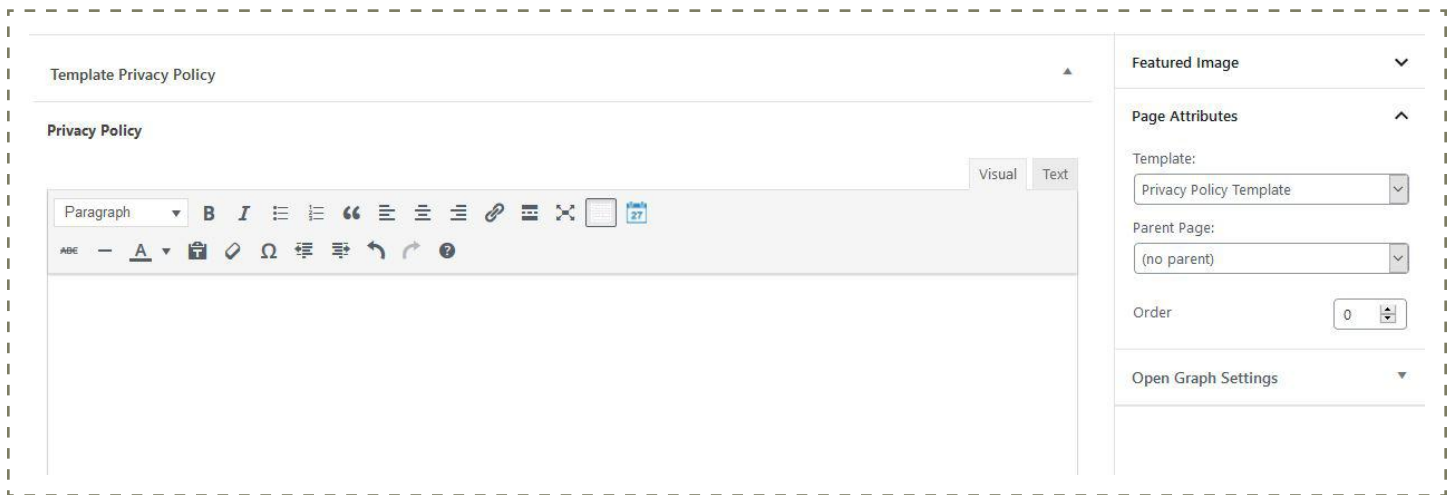

Image 14 - Backend look of Privacy Policy Template

Passive Templates

Passive templates are templates where content is automatically created, and it cannot be changed on that page. Content depends on custom posts or widgets and it is needing to have those pages in order to show posts of specific custom posts.

Blog Template

Displaying all posts and sidebar with widgets.

Calendar Template

Displaying Calendar with plugin.

Nav1 Template

Displaying all posts from Nav1 custom post.

Our Team Template

Displaying all team members from Our Team custom post.

These templates are just displaying and listing posts, custom posts or widgets, do not need to be filled with content.

Theme Settings

Most WordPress themes have a Theme settings page to customize its features, behavior and styles. Providing a theme settings page with the theme makes it easy for users to customize the theme instead of directly editing the PHP or CSS files. This makes updating the theme easier, as users will not lose the changes they've made.

Theme Settings General

Theme Setting General contains default and specific settings for all pages. Those pages are divided with different tabs (General, About School, Nav1, Nav2, Nav3, etc.) and each tab has an option to change text, color for text, headings and buttons.

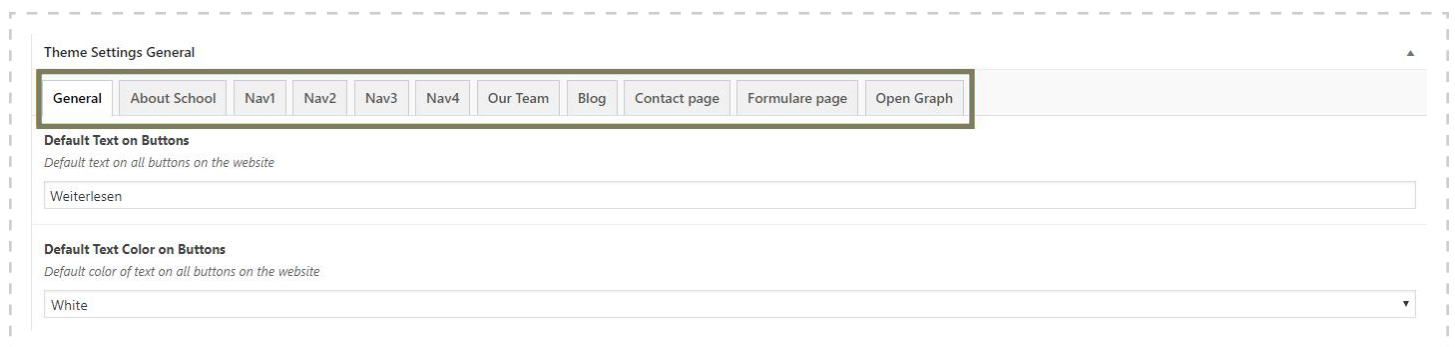

Image 15 - Backend look of Theme Settings General

Header

Here in header theme settings, the logo can be changed or added, as well the banner image, favicon and there are Navigation settings where text color, background and hamburger menu color can be changed.

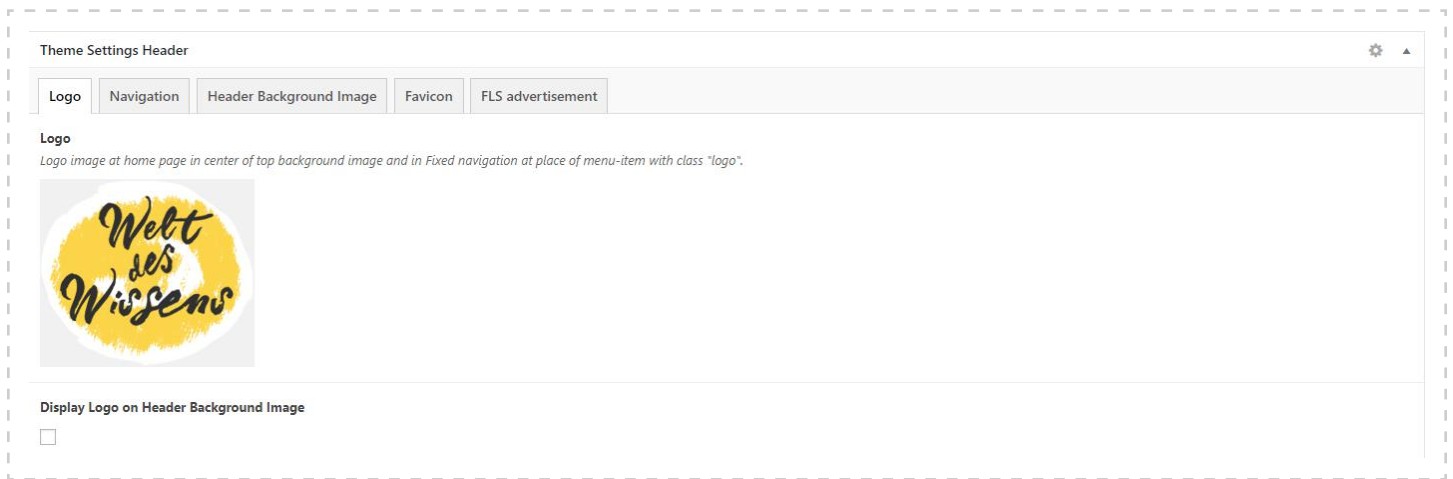

Image 16 - Backend look of Theme Settings Header

Footer

Footer theme Settings contains fields for footer setup. Here, Footer Background color, Footer Pattern and pattern color can be changed as well as edited footer content and section which will be displayed. Also, here Impressum page can be chosen from already created page.

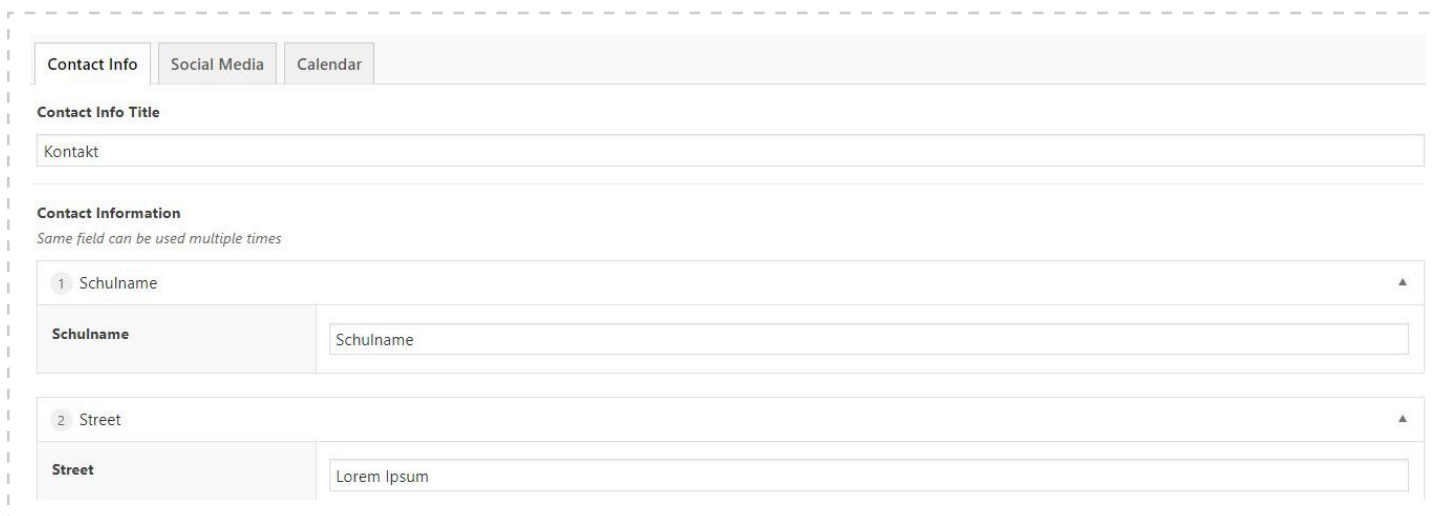

Image 17 - Backend look of Theme Settings Footer

Footer content

Footer content represents any added content in footer, which can be Contact information, Social media and Calendar. Under this option, it can be chosen which information need to be in the footer. It can be

either one of them, two or even all three options.

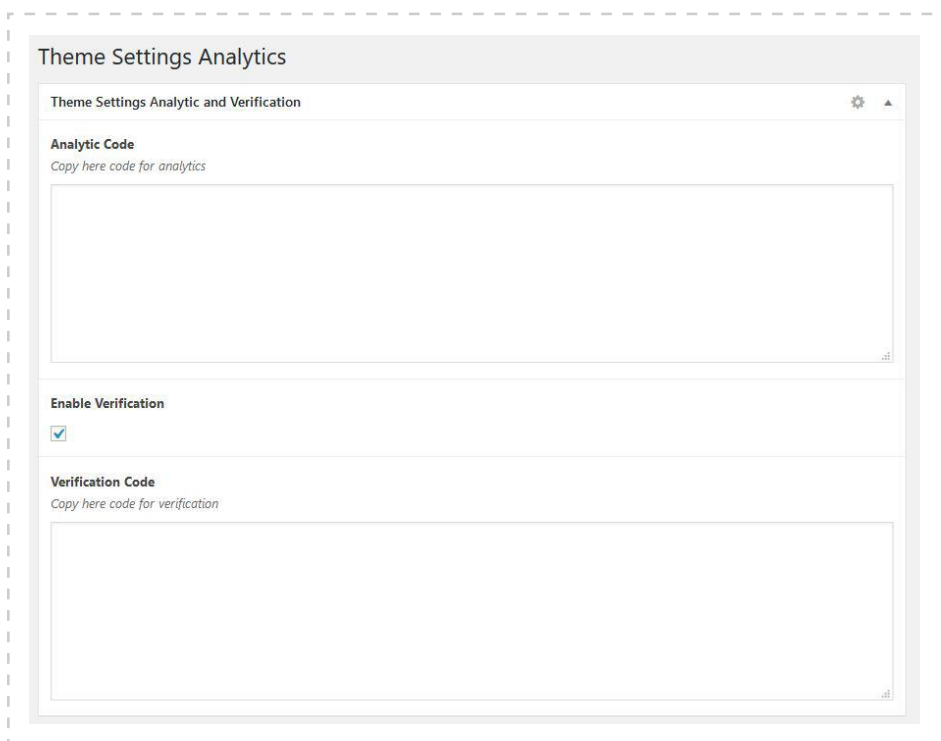

The image shows a backend settings interface for a footer. It features three tabs: 'Contact Info', 'Social Media', and 'Calendar'. The 'Contact Info' tab is active. Below the tabs, there is a 'Contact Info Title' field with the value 'Kontakt'. Underneath, a section titled 'Contact Information' contains a note: 'Same field can be used multiple times'. This section has two numbered steps. Step 1, 'Schulname', shows a label 'Schulname' and a text input field containing 'Schulname'. Step 2, 'Street', shows a label 'Street' and a text input field containing 'Lorem Ipsum'.

Image 18 - Backend look of Theme Settings Footer

Website Analytic

Website Analytic is optional, therefore if there is no need for website monitoring, these fields should be empty. But, if there is active website monitoring, code for that should be added under “Analytic Code” and received verification code from Google should go under “Verification code”.

The image shows a backend settings interface for website analytics. It has a title 'Theme Settings Analytics' and a subtitle 'Theme Settings Analytic and Verification'. The 'Analytic Code' section has a note 'Copy here code for analytics' and a large text area. Below this, the 'Enable Verification' section has a checked checkbox. The 'Verification Code' section has a note 'Copy here code for verification' and a large text area.

Image 19 - Backend look of Theme Settings Website Analytic

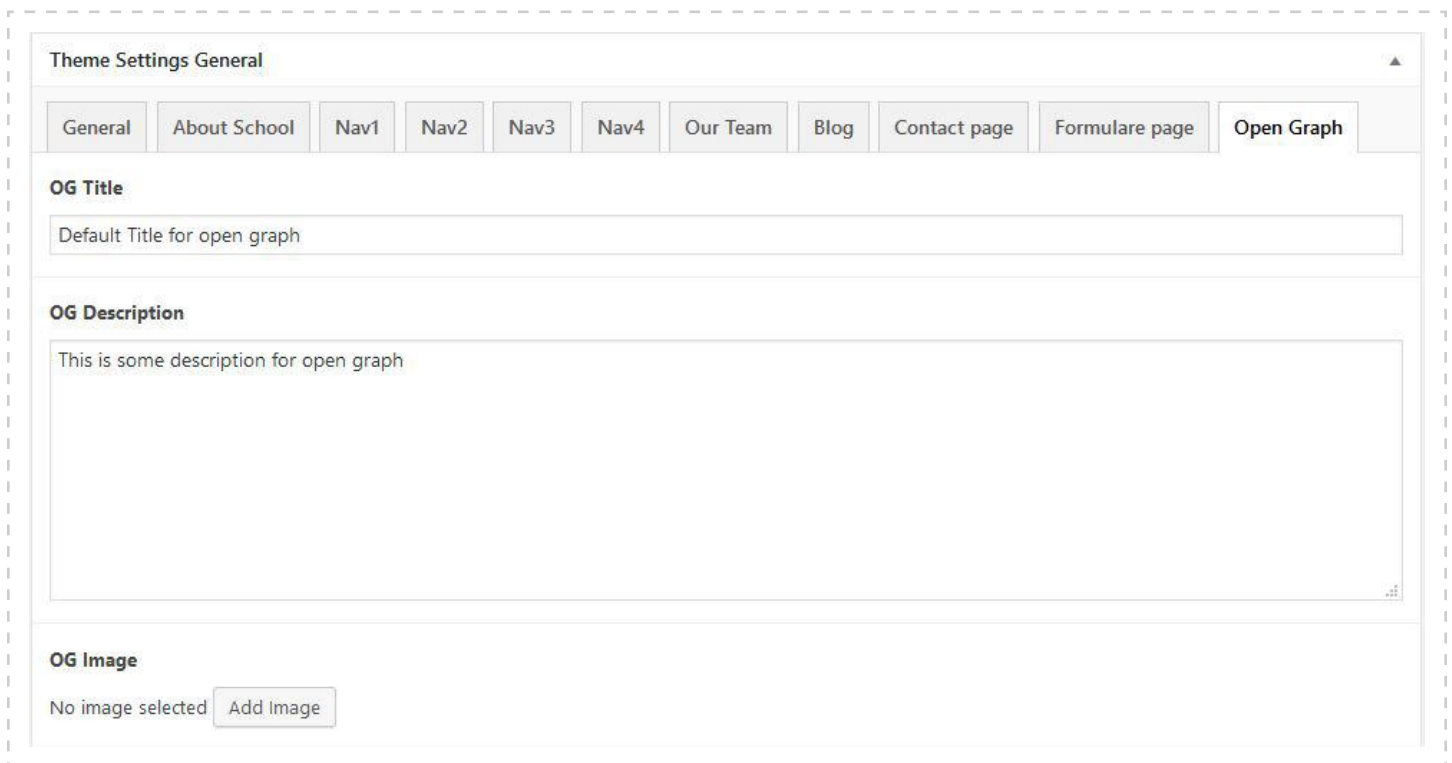

Open Graph

Open Graph (OG) is a technology first introduced by Facebook in 2010 that allows integration between Facebook and its user data and a website. By integrating Open Graph meta tags into your page's content, you can identify which elements of your page you want to show when someone share your page.

For example, you could use the og:image tag to specify what image you want Facebook to use when your page is shared. By specifying Open Graph information, Facebook doesn't have to guess what information to use when your page is shared.

Set Open Graph

There are default Open Graph settings in Theme Settings under Open Graph tab and in every single post same under Open Graph tab where image, title and description can be set for sharing website on social media network.

The image shows a screenshot of the 'Theme Settings' interface, specifically the 'Open Graph' tab. The interface is enclosed in a dashed border. At the top, there's a header 'Theme Settings General' with a dropdown arrow. Below it is a row of tabs: 'General', 'About School', 'Nav1', 'Nav2', 'Nav3', 'Nav4', 'Our Team', 'Blog', 'Contact page', 'Formulare page', and 'Open Graph'. The 'Open Graph' tab is selected and highlighted. The main content area is divided into three sections: 'OG Title' with a text input field containing 'Default Title for open graph'; 'OG Description' with a larger text area containing 'This is some description for open graph'; and 'OG Image' with the text 'No image selected' and an 'Add Image' button.

Image 20 - Backend look of Theme Settings - Open Graph tab

Fields and blocks of content

Theme is based on ACF (Advanced Custom Field) plugin to simplify managing content to users. All blocks can be reordered by simple drag and drop, which make it very easy to change website content and its order.

Home Page

Paragraph and Image

This type shows Title and paragraph on one side, and on the other side displays image as it is shown on the image below. (Image 20)

Image 21 - Frontend look of Paragraph and Image content block

It is easily editable in the backend as shown on Image 21. Numbering shows the correlation between frontend and backend.

Fields in backend

Unordered List

The difference between Ordered and Unordered list is that for Ordered the order is important and it is numerical. On the other hand, the listed things Unordered list have no priorities between each other and it is displayed with bullets, as shown on Image 51.

To add new rows, by hovering on the place where you want to put it, symbols “+” and “-” will appear. Otherwise, you can press **Add Row** button as shown on Image 52.

MENUS / NAVIGATIONS

To create menu, you must navigate to **Appearance** -> **Menus**. In order to edit Menus/Navigations, you need to open **Screen Options** which can be found at the top of the screen (Image 53) and check **CSS Classes**.

Image 55 - Screen Options for Menu

There are three menu/navigation looks:

Main WP navigation

This is navigation located at the top of the front page

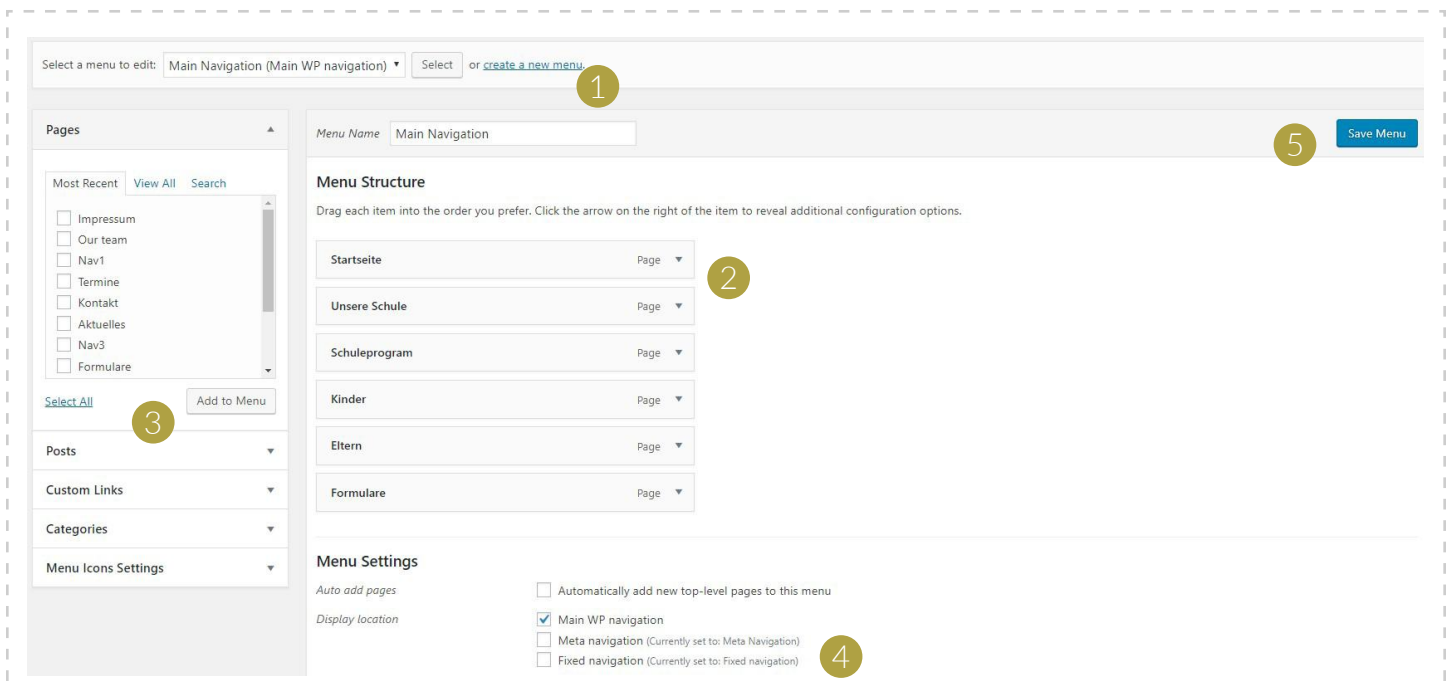

Image 56 - Navigation on Home page at the top

To edit menu, first select from the dropdown menu **Main Navigation (Main WP Navigation)** ① and press **Select** button. Next, in **Menu Structure** section select one of the labels (Example: Startseite). ② Each label you can edit: name, order, link to page, remove and you can create new one. When creating, first, select from **Pages, Posts, Custom Links or Categories** section ③ the page and press **Add to Menu** button. Afterwards, check in **Menu Settings** section type of navigation, in case you want to change. ④ When you are done with changes, in order to save it, you need to press **Save Menu** button. ⑤

Meta navigation

This navigation is visualized as buttons on Home page.

Image 57 - Meta Navigation buttons

Note: To change color of buttons, in Meta navigation > Menu Structure > Single menu item (example: Sample page) need to add class in **CSS Classes** (optional) field.

Class for colors

 button-aegean : Aegean Blue	 button-pear : Pear Green
 button-black : Black	 button-purple : Purple
 button-candy : Candy Red	 button-salmon : Salmon
 button-honey : Honey	 button-sky-blue : Sky Blue
 button-light-blue : Light Blue	 button-teal : Teal Blue
 button-peanut : Peanut	 button-white : White

Fixed navigation

This is navigation which is displayed when users scroll down on Home page and main navigation for all other pages of the website

Note: To display logo in Fixed navigation, you need to go to Fixed navigation > Menu Structure > Single

menu item (example: Sample page) and then add class **meta-btn** and, separated with space, add class of color from above in **CSS Classes** (optional) field.
